

Working Report

Full-stack session — WhatsApp integration, Unicommerce sync & dashboard enhancements

Date: June 04, 2026 · Prepared by: Engineering Team

01 · WhatsApp Number Migration

Overview

Successfully migrated a WhatsApp Business number from AiSensy to a direct Meta integration. The process involved manual API calls since AiSensy's UI provides no deregister option.

Steps Completed

Deregistration	Called Meta deregister API manually via <code>deregister.js</code> — AiSensy UI had no direct option
Registration	Re-registered number with new app using <code>register.js</code> + OTP verification flow
OTP Flow	<code>request_code.js</code> → <code>verify_code.js</code> — full code request and verification pipeline
Permanent Token	Generated via <code>get_permanent_token.js</code> — stores long-lived access token
Webhook Setup	Configured ngrok tunnel, set webhook URL, completed Meta token handshake verification
Error Fix	Resolved error 133006 (phone re-verification required) encountered mid-migration

02 · WhatsApp Webhook & Message Storage

Built `wa-webhook.js` from scratch to handle all incoming WhatsApp events.

- Receives incoming messages and delivery/read status updates from Meta
- Added `resolveMediaUrl()` — fetches Meta media URLs with auth header
- Introduced `wamid://MEDIA_ID` prefix storage pattern for deferred media resolution
- Stores full message metadata to `wa_messages` DB: direction, type, text, media_url, status
- Proper failed-status logging: `[wa-webhook] SEND FAILED to...`
- Fixed silent DB errors in send routes — replaced `.catch(()=>{})` with upsert + `console.error`

03 · Media Proxy Endpoint

Built a backend proxy endpoint so the frontend can render WhatsApp media (images, documents, audio) without exposing Meta auth tokens to the client.

Endpoint	<code>GET /api/whatsapp/media/:mediaId</code> — fetches from Meta, pipes response to browser
Auth	Adds Bearer token server-side; client never sees the credential
API Version Fix	Corrected <code>v18.0</code> → <code>v19.0</code> — was causing silent fetch failures
Error Logging	Now logs actual Meta error response body instead of generic 'fail' message

04 · AI Triage for WhatsApp

Extended the existing AI triage system to support WhatsApp conversations, with platform-specific cooldown logic.

- Built `triageWAConversation()` in `classify.js`
- Reads messages from `wa_messages` DB — not the slow Graph API
- 5-minute reclassification cooldown (vs 24h for FB/IG) — WhatsApp is higher-cadence
- Upserts triage result to `conversation_meta` with `platform: 'whatsapp'`
- Wired into `/api/triage` in `index.js` — routes `platform=whatsapp` to new function

05 · Dashboard — WhatsApp Integration

Merged WhatsApp conversations into the unified inbox Dashboard, matching the existing shape used by Facebook and Instagram conversations.

Shape Normalisation	WA conversation objects normalised to FB/IG format with <code>_wa</code> flag
List Merge	WA convs merged into Dashboard <code>conversations</code> array alongside FB/IG
getName / getPic	Both helpers updated to handle <code>_wa</code> flag for correct display name and avatar
Platform Label	WhatsApp badge added — green <code>#25D366</code>
Fetch Messages	<code>fetchMessages</code> WA branch calls <code>/api/whatsapp/messages/:phone</code>
Send Reply	<code>handleSendReply</code> WA branch calls <code>/api/whatsapp/send</code>
Template Bubbles	Template message bubbles rendered separately in Dashboard message thread

06 · Failed Message Display

End-to-end visibility for failed outbound messages — from webhook detection to UI indicator.

- Webhook detects `s.errors?.length > 0` → writes `status: 'failed'` to DB
- WhatsAppInbox: failed messages show **Failed to send** in red instead of double-tick
- Dashboard WA thread: same logic applied — consistent UX across both views

07 · WhatsApp Web UI Styling

Styled the WhatsApp inbox to match the familiar WhatsApp Web design language.

Component	Class / Value	Note
Avatar background	<code>#075E54</code> / <code>#128C7E</code>	WA dark-green palette
Sent bubble	<code>bg-[#dcf8c6]</code>	Classic WA green, dark text
Header bar	<code>bg-[#075E54]</code>	Dark teal
Unread badge	<code>bg-[#25D366]</code>	Bright green
Conv hover/select	<code>bg-[#f0f2f5]</code>	WhatsApp Web grey
Template bubbles	<code>Styled separately</code>	Distinct from regular messages
Empty state	<code>whatsapp web style</code>	Matching official empty-chat look

08 · Contacts — Server-Side Pagination

- **API Route** — `GET /api/whatsapp/contacts?page=1&limit=20&search=query`
- **Debounced Search** — 350ms debounce on search input, calls `loadContacts(pg, q)`
- **Infinite Scroll** — next page loaded on demand as user scrolls
- **Lists Separation** — `loadLists()` separated from contacts fetch to avoid blocking render

09 · Orders Feature (Unicommerce)

Built a complete order lookup system connecting to the Unicommerce Supabase database, integrated into the Dashboard chat view.

Backend

- Built `server/routes/orders.js` — connects to orders Supabase DB (`ibrsivgmxeuvgrflmfl`)
- `GET /api/orders/search?q=` — searches `voucher_number`, `po_number`, `customer_phone`, `customer_email`
- Fixed wrong column names after inspecting real schema: `voucher_number` (not `code`), `total_value` (not `total_amount`)
- Added `ORDERS_SUPABASE_URL` + `ORDERS_SUPABASE_KEY` to `.env`

Dashboard Integration

- Auto-detects order numbers in chat messages and summary text
- `extractOrderNumbers()` — regex excludes Indian mobile numbers (10-digit starting 6–9)
- Orders panel only shown when an order number is detected — not always visible
- Fixed duplicate items → grouped by product name, summed quantity
- Card UI: golden border, yellow header bar, clean customer row, bordered items table

10 · Unicommerce Ingest Sync

Debugged and fixed the standalone sync pipeline that pulls orders from Unicommerce and pushes them to Supabase via an edge function.

401 Error Root Cause	Mismatch between ingest script secret and <code>UNI_INGEST_SECRET</code> stored in Supabase env
After Fix	Confirmed successful sync: 25 orders, 120 items, 20 new parties inserted on last run
Data Storage	Orders → <code>orders</code> , line items → <code>order_items</code> , customers → <code>parties</code> , channels → <code>sales_channels</code>
OAuth Tokens	Stored in <code>unicommerce_tokens</code> table

11 · Backend Debug Logging Table

Created a structured logging infrastructure within Supabase for tracing edge function executions.

Table Schema — `backend_debug_logs`

Column	Type	Purpose
<code>id</code>	<code>uuid</code>	Primary key
<code>source</code>	<code>text</code>	Which edge function / service logged this
<code>level</code>	<code>text</code>	info / warn / error
<code>run_id</code>	<code>uuid</code>	Groups all logs from a single sync run

message	text	Human-readable event description
context	jsonb	Structured payload (request params, counts, errors)
created_at	timestamptz	Log timestamp
updated_at	timestamptz	Last update

Logger Instrumentation

- Injected `dbg()` helper into `unicommerce-ingest-orders` edge function
- Traces written for: `request_received`, `completed`, `unauthorized`, `exception` events
- Each trace includes structured context (counts, params) and unique `run_id`
- RLS policy added — authenticated reads only

12 · Unicommerce UI Cleanup & Performance

UI Cleanup

- Removed time-range input, 'Preview raw' button, and 'Sync now' button from `/unicommerce`
- Added Filters button with active-filter badge (shows count of active filters)

Advanced Filter Modal

- Start date & end date pickers
- Customer selection dropdown (combobox)
- Value operator: greater than / less than / equal / between — with amount inputs
- All filters wired into filtered orders memo

Performance Fixes

Debounced Search	Replaced per-keystroke filtering with <code>useDeferredValue</code> — snappy even at 1000+ orders
Server-Side Pagination	Fetch 20 orders/page via <code>.range()</code> + <code>count: 'exact'</code> ; dropped heavy joins
Lazy Item Fetch	Order items fetched per-accordion on open and cached; Skeleton shown while loading
Parties Page Size	Reduced from 50 → 20 per page; Prev/Next pager footer added
Searchable Combobox	Customer <code><Select></code> replaced with Popover + Command (<code>cmdk</code>); customer list fetched once on mount (limit 5000)

13 · Navigation Changes & Payment Issue (131042)

Navigation

- Removed WhatsApp from `ConversationList` platform filter tabs (tabs now: All / Facebook / Instagram only)
- Added WhatsApp as a dedicated nav item in sidebar via `NavBar.jsx`

Payment Issue — Error 131042

Diagnosis	AiSensy credit line allocated to WABA <code>190083667517741</code>
Meta UI Block	Meta UI shows: 'monthly invoicing not supported to change' — payment method locked
Resolution Path	AiSensy must deallocate credit line from their side — escalation required

Session Summary

This report covers 13 major work items completed on June 04, 2026. Key outcomes: full WhatsApp integration (migration, webhook, media proxy, triage, dashboard, UI), Unicommerce orders feature with smart detection, sync pipeline fixed & confirmed operational, and performance improvements across Contacts and Unicommerce pages.

Status

- ✓ WhatsApp Integration
- ✓ Unicommerce Sync
- ✓ Orders Feature
- Payment Issue (AiSensy)
